PRACTICAL NO 2. A

AIM : Use CryptTool to encrypt and decrypt passwords using RC4 algorithm.

Encryption (RC4) :

Encryption is the process of converting plain text (readable data) into cipher text (encrypted data) using the RC4 algorithm and a secret key. This ensures that only authorized users with the correct key can read the original information.

Decryption (RC4) :

Decryption is the process of converting the cipher text back into the original plain text using the same secret key used during encryption in the RC4 algorithm. This restores the original readable data.

The screenshot shows the CryptTool 1.4.4Z application window. The title bar reads "CryptTool 1.4.4Z - [RC4 decryption of <RC4 encryption of <RC4 decryption of <RC4 decryption of <RC4 encryption..., key <...>]". The menu bar includes File, Edit, View, Encrypt/Decrypt, Digital Signatures/PKI, Indiv. Procedures, Analysis, Options, Window, and Help. The "Encrypt/Decrypt" menu is open, displaying options: Symmetric (classic) >, Symmetric (modern) >, Asymmetric >, Hybrid >, IDEA..., RC2..., RC4..., DES (ECB)..., DES (CBC)..., Triple DES (ECB)..., Triple DES (CBC)..., AES (CBC)... (with Shift + Strg + R shortcut), Further Algorithms >, and AES (self extracting)... The taskbar at the bottom shows the system clock as 12:52 on 21-07-2026, along with weather information (30°C Cloudy) and various background applications.
